

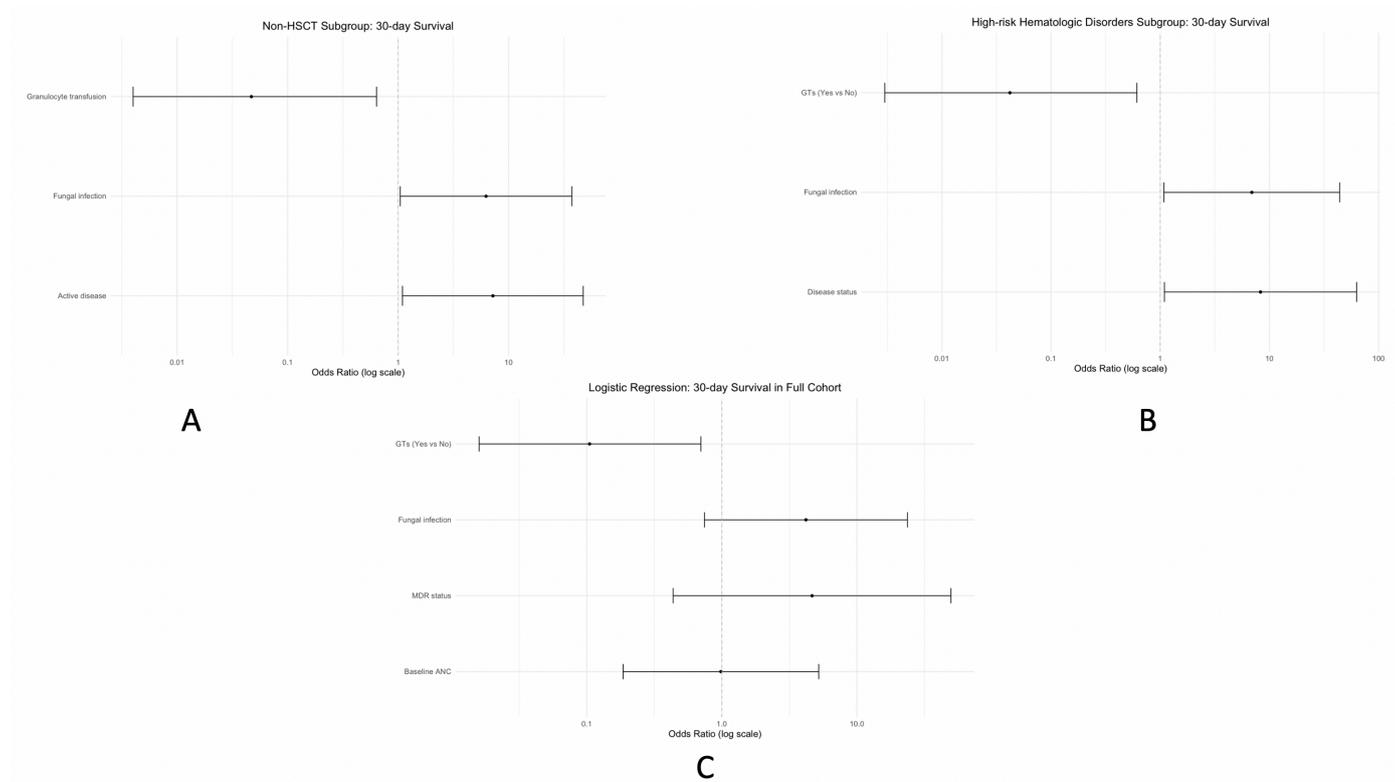

Figure S1. Forest plots of multivariable logistic regression for 30-day survival across clinical subgroups.

Forest plots of adjusted odds ratios (OR) for 30-day survival from multivariable logistic regression across key subgroups. (A) Non-HSCT subgroup; (B) High-risk hematologic disorders subgroup; (C) Total cohort. The models were adjusted for relevant clinical confounders in each subgroup. OR estimates and the corresponding 95% confidence intervals (CI) are shown. The reference line indicates OR=1.
