

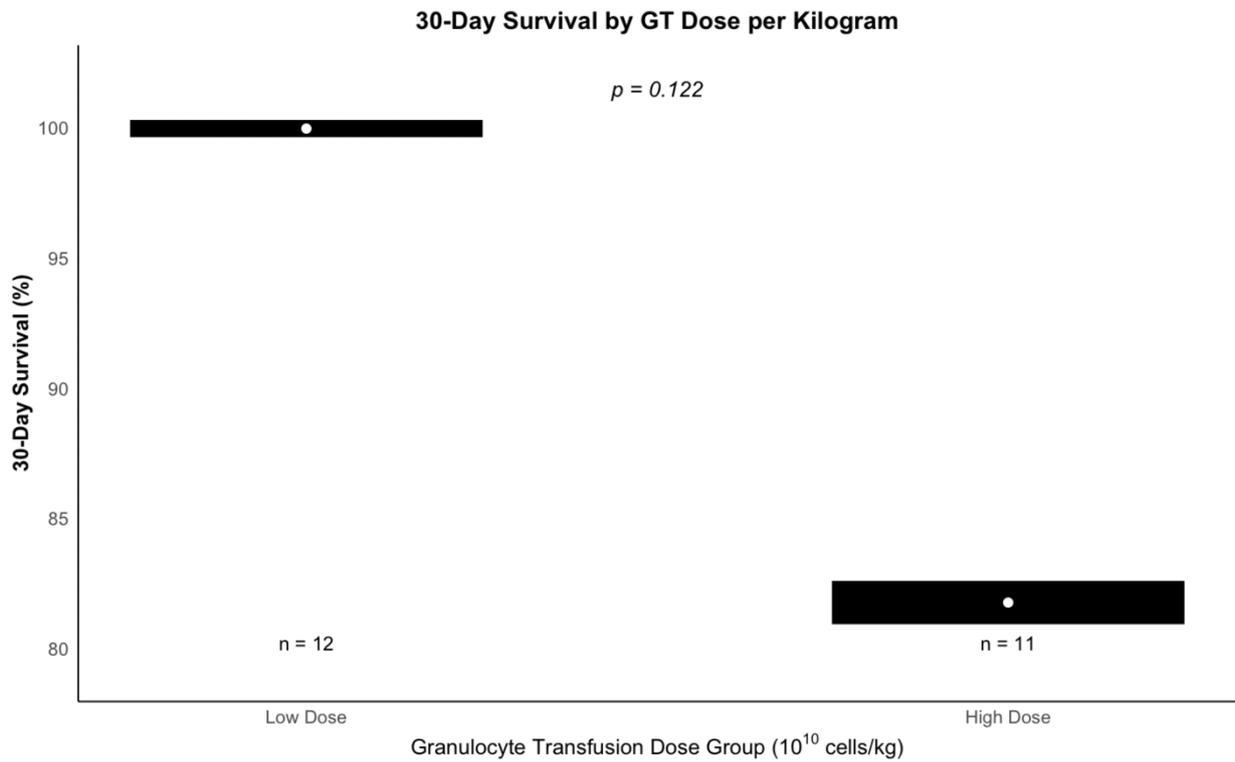

Figure S12. 30-day survival stratified by granulocyte transfusion (GT) dose per kg group.

Box plot showing survival in patients receiving low-dose ($\leq 0.1727 \times 10^{10}$ cells/kg) versus high-dose ($> 0.1727 \times 10^{10}$ cells/kg) GT. Survival was 100% in the low-dose group (12/12) and 81.8% in the high-dose group (9/11); the difference was not statistically significant ($p = 0.122$).
