

Table S18. Multivariable logistic regression for 30-day survival focusing on G-CSF dose group (adjusted for GT)

Variable	Adjusted OR	95% CI	P- Value
High-dose G-CSF (Versus Low dose)	0.42	0.03-5.71	0.512
GT x High-dose G-CSF interaction	0.000	-	0.999

Multivariable logistic regression analysis focusing on the effect of G-CSF dose group on 30-day survival. The model was adjusted for granulocyte transfusion (GT). Neither the high-dose G-CSF nor the interaction term showed significant independent association with survival.
