

Table S19. 30-day survival by G-CSF dose group (median cut-off: $7 \times 10^6/\text{kg}$)

G-CSF dose group	Survived n (%)	Died n (%)	Total n (%)	p-Value
Low Dose ($\leq 7 \times 10^6/\text{kg}$)	10 (63)	6 (37)	16 (100)	0.029
High Dose ($> 7 \times 10^6/\text{kg}$)	12 (100)	0 (0)	12 (100)	
Total	22 (79)	6 (21)	28 (100)	

Comparison of 30-day survival by G-CSF dose group. The patients were classified using a median cut-off of $7 \times 10^6/\text{kg}$ (calculated median dose $6.9048 \times 10^6/\text{kg}$). High dose G-CSF was significantly associated with higher unadjusted survival ($p=0.029$, Fisher's Exact Test)
