

**Table S6. Landmark day 10 analysis**

<b>Variable</b>	<b>Adjusted OR</b>	<b>95% CI</b>	<b>p-Value</b>
Granulocyte Transfusion (GT)	0.084	0.007-1.071	0.057
Fungal infection	6.581	0.967-44.793	0.054
Active Disease Status	3.542	0.36-34.808	0.278

Multivariate logistic regression for 30-day survival in the high-risk hematologic disorder subgroup using a 10-day landmark analysis (n = 45). Only patients who survived  $\geq 10$  days after febrile neutropenia onset were included to minimize immortal time bias. The model adjusts for granulocyte transfusion (GT), fungal infection, and disease status. While the association between GT and improved survival showed a strong trend, it did not reach statistical significance (p = 0.057).
