

Supplementary Fig. 1. Interindividual variability in treatment-associated changes in serum soluble C5b-9 (sC5b-9) levels. Waterfall plot depicting the absolute change in serum sC5b-9 concentration (posttherapy minus pretherapy) for each patient sorted from the greatest decline to the greatest increase. Most patients exhibited a substantial reduction in sC5b-9 levels after therapy, whereas a small subset showed minimal changes or persistent elevations, highlighting the interindividual heterogeneity in treatment-associated responses.
